

# Banker's Algorithm

**DCS4103 Operating System** 

#### **Banker's Algorithm**

• The number of resources of each type currently allocated **Allocation** to each process. • The maximum demand of each process in the system Max Available • The number of available resources of each type (Work) Need • The remaining resource need for each process

# Example

Considering the following example of a system, check whether the system is safe or not; using Banker's algorithm. Determine the sequence if it is safe.

| Process | A     | Allocatio | n     |       | Max   |       | Available (Work) |       |       |  |
|---------|-------|-----------|-------|-------|-------|-------|------------------|-------|-------|--|
|         | $R_1$ | $R_2$     | $R_3$ | $R_1$ | $R_2$ | $R_3$ | $R_1$            | $R_2$ | $R_3$ |  |
| $P_0$   | 0     | 1         | 0     | 7     | 5     | 3     | 3                | 3     | 2     |  |
| $P_1$   | 2     | 0         | 0     | 3     | 2     | 2     |                  |       |       |  |
| $P_2$   | 3     | 0         | 2     | 9     | 0     | 2     |                  |       |       |  |
| $P_3$   | 2     | 1         | 1     | 2     | 2     | 2     |                  |       |       |  |
| $P_4$   | 0     | 0         | 2     | 4     | 3     | 3     |                  |       |       |  |

# Solution - Step 1 (Calculate Need)

$$R_i (Need) = R_i (Max) - R_i (Allocation)$$

| Process | Allocation |       |       | Max   |       |       | Available (Work) |       |       | Need  |       |           |
|---------|------------|-------|-------|-------|-------|-------|------------------|-------|-------|-------|-------|-----------|
|         | $R_1$      | $R_2$ | $R_3$ | $R_1$ | $R_2$ | $R_3$ | $R_1$            | $R_2$ | $R_3$ | $R_1$ | $R_2$ | $R_3$     |
| $P_0$   | 0          | 1     | 0     | 7     | 5     | 3     | 3                | 3     | 2     | 7     | 4     | 3         |
| $P_1$   | 2          | 0     | 0     | 3     | 2     | 2     |                  |       |       | )     | ~     | $\langle$ |
| $P_2$   | 3          | 0     | 2     | 9     | 0     | 2     |                  |       |       | 6     | 0     | 6         |
| $P_3$   | 2          | 1     | 1     | 2     | 2     | 2     |                  |       |       | 0     | 1     | 1         |
| $P_4$   | 0          | 0     | 2     | 4     | 3     | 3     |                  |       |       | 4     | 3     | 1         |

## Solution - Step 2 (Perform Banker's Algorithm)

If  $Need_i \leq Work_i$  then

Update Work = work + allocation

Else

 $Process_i$  wait
